

Web Application Development Lab

Experiment No – 01

Aim – Authentication using Java Servlet

Theory

The following is an authentication form, which validates the Login ID and Password keyed in by the user and returns an appropriate page generated by a Servlet code. First of all you will create one table in M.S Access as shown below:

Table Definitions:

Table Name : login[SchoolDemo.mdb]
Primary Key : Nil
Foreign Key : Nil

Column Definition:

Column Name	Data Type	Width
Loginname	Text	20
Password	Text	20

Table Description:

Column Name	Description
Loginname	Identification of the person filling the Login form.
Password	Password entered by the person

Explanation:

When the user submits the login name and password. A check is made in the table for that user name and password. If the user name and password match a single entry a welcome page will be returned, or else access denied page will be returned.

After create table in M.S. Access database now you will create DSN.

Test Records:

login[SchoolDemo.mdb]

Loginname	Password
-----------	----------

laura	Cath
-------	------

mirella	mrsbean
---------	---------

bintu	12345
-------	-------

Following is the source code of the HTML page i.e. Login.html:

```
<HTML>
<HEAD>
  <TITLE> SCT's User Authentication Form </TITLE>
</HEAD>

<BODY Background="images/grid1.gif">
  <BR><BR>

  <CENTER>
    <H2><B> User's Authentication Page </B></H2>
  </CENTER>

  <FORM Action="../servlets/login" Method="POST">
    <BR><BR>

    <TABLE Border="0" CellPadding="5" CellSpacing="0" Width="400"
Align="Center">
      <FONT Color="#000000" Size="2">
        <TR>
          <TD Align="Right">
            <B>Login Name:</B>
          </TD>
          <TD>
            <INPUT Type="Text" Name="Loginid" Size="20">
          </TD>
        </TR>

        <TR>
          <TD Align="Right">
            <B>Password:</B>
          </TD>
          <TD>
```

```

        <INPUT Type="Password" Name="Password" Size="20">
    </TD>
</TR>
</FONT>
</TABLE>
<BR><BR>

<P></P>
<P></P>
<CENTER>
    <Input Type="Submit" Value="Submit" Name="Submit">
    <Input Type="Reset" Value="Reset" Name="Reset">
</CENTER>
</FORM>
</BODY>
</HTML>

```

The following is the source code for "login.java:

```

import java.sql.*;
import java.io.*;
import javax.servlet.*;
import javax.servlet.http.*;

public class login extends HttpServlet
{
    Connection conn;

    public void service(HttpServletRequest request,
        HttpServletResponse response)
        throws IOException
    {

```

```

ServletOutputStream out=response.getOutputStream();

        String url="jdbc:odbc:MyDsn";

try
{
    String login=request.getParameter("Loginid");
    String pass=request.getParameter("Password");

    Class.forName("sun.jdbc.odbc.JdbcOdbcDriver");
    conn=DriverManager.getConnection(url);
    Statement stmt=conn.createStatement();
    ResultSet rs=stmt.executeQuery("select * from login where
loginname='" + login + "' and password= '" + pass + "'");

    response.setContentType("text/html");
    response.setStatus(HttpServletResponse.SC_OK);

    if(rs.next()==false)
    {
        out.println("<BR><BR><BR><BR><BR>");
        out.println("<html><head><title>Login
check</title></head><body>");
        out.println("<CENTER><B>Unknown User</B>");
        out.println("<BR><BR>");
        out.println("<h3> Access Denied</h3></CENTER>");
        out.println("<BR><BR><BR>");
        out.println("<CENTER><Input Type=Button
Value=Back></CENTER>");
        out.println("</body></html>");
    }
    else
    {
        out.println("<html><head><title>Login
Check</title></head><body>");
    }
}

```

```

        out.println("<BR><BR><BR><BR><BR>");
        out.println("<CENTER><B>Welcome " + " " +
rs.getString("loginname") + "</B></CENTER>");
        out.println("<CENTER>");
        out.println("<h3> You have been Authenticated</h3></CENTER>");
        out.println("<BR><BR><BR>");
        out.println("<CENTER><Input Type=Button
Value=HOME></CENTER>");
        out.println("</body></html>");
    }
    conn.close();
}
catch(SQLException SQLExcp)
{
    out.println("SQLException: " + SQLExcp);
}
catch(ClassNotFoundException clsNotFndExcp)
{
    System.out.println("Cannot find the class: "+ clsNotFndExcp);
}
}
}
}

```

To run the above servlet program , first of all run Apache Tomcat from "Start -> All Programs -> Apache Tomcat 4.0 -> Start Tomcat."

Now compile Java Servlet Program using below command as shown diagram 1.1

Diagram 1.1 Compile Java Servlet

Now, copy "SimpleServlet.class" File and then paste it under

"C:/Program Files/Apache Tomcat 4.0/webapps/examples/WEB-INF/classes/"

Now, open your any web browser and type html URL where you saved your login.html file. for example:

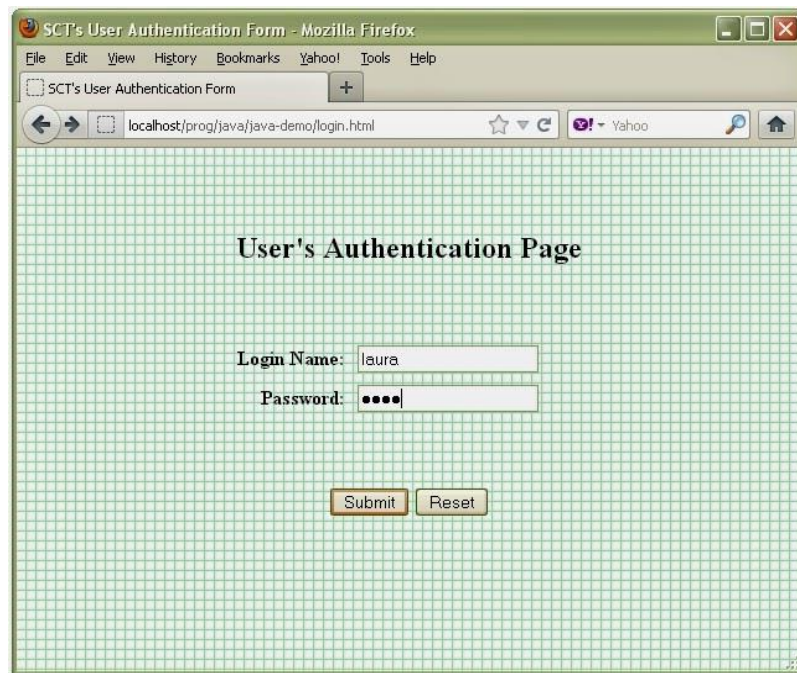

Diagram 1.2 Output of Login.html

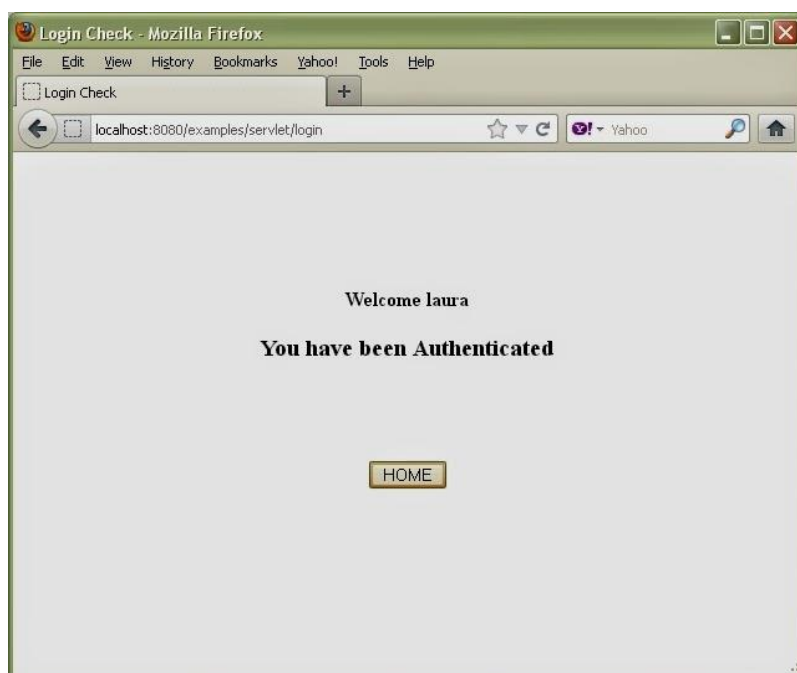

Diagram 1.3 Output of login.class for a valid username and password

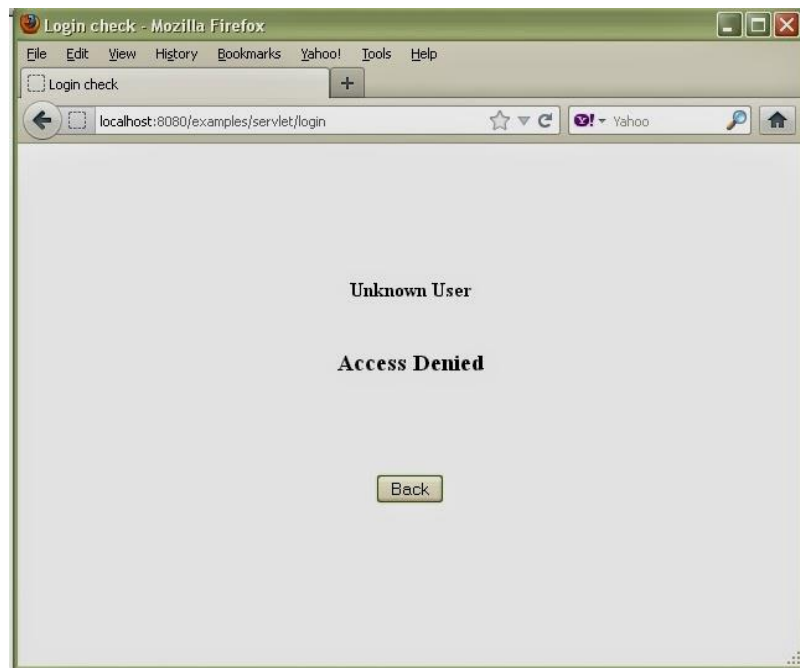

Diagram 1.4 Output of login.class for an invalid username and password

Conclusion

Authentication using Java Servlet is done successfully.

Experiment No – 02

Aim – Authentication using JSP.

Theory

JavaServer Pages and servlets make several mechanisms available to Web developers to secure applications. Resources are protected declaratively by identifying them in the application deployment descriptor and assigning a role to them.

Several levels of authentication are available, ranging from basic authentication using identifiers and passwords to sophisticated authentication using certificates.

Role Based Authentication

The authentication mechanism in the servlet specification uses a technique called role-based security. The idea is that rather than restricting resources at the user level, you create roles and restrict the resources by role.

You can define different roles in file tomcat-users.xml, which is located off Tomcat's home directory in conf. An example of this file is shown below –

```
<?xml version = '1.0' encoding = 'utf-8'?>
<tomcat-users>
  <role rolename = "tomcat"/>
  <role rolename = "role1"/>
  <role rolename = "manager"/>
```

```
<role rolename = "admin"/>
<user username = "tomcat" password = "tomcat" roles =
"tomcat"/>
<user username = "role1" password = "tomcat" roles = "role1"/>
<user username = "both" password = "tomcat" roles =
"tomcat,role1"/>
<user username = "admin" password = "secret" roles =
"admin,manager"/>
</tomcat-users>
```

This file defines a simple mapping between username, password, and role. Notice that a given user may have multiple roles; for example, username = "both" is in the "tomcat" role and the "role1" role.

Once you have identified and defined different roles, role-based security restrictions can be placed on different Web Application resources by using the <security-constraint> element in web.xml file available in the WEB-INF directory.

Following is a sample entry in web.xml –

```
<web-app>
...
<security-constraint>
  <web-resource-collection>
    <web-resource-name>SecuredBookSite</web-resource-name>
    <url-pattern>/secured/*</url-pattern>
    <http-method>GET</http-method>
    <http-method>POST</http-method>
  </web-resource-collection>

  <auth-constraint>
```

```
<description>
  Let only managers use this app
</description>
<role-name>manager</role-name>
</auth-constraint>
</security-constraint>

<security-role>
  <role-name>manager</role-name>
</security-role>

<login-config>
  <auth-method>BASIC</auth-method>
</login-config>
...
</web-app>
```

The above entries would mean –

- Any HTTP GET or POST request to a URL matched by /secured/* would be subject to the security restriction.
- A person with the role of a manager is given access to the secured resources.
- The login-config element is used to describe the BASIC form of authentication.

If you try browsing any URL including the /security directory, the following dialog box will be displayed asking for username and password. If you provide a user "admin" and password "secret", then you will have access on the URL matched by /secured/* as we have defined the user admin with manager role who is allowed to access this resource.

Form Based Authentication

When you use the FORM authentication method, you must supply a login form to prompt the user for a username and password. Following is a simple code of login.jsp. This helps create a form for the same purpose –

```
<html>
  <body bgcolor = "#ffffff">

    <form method = "POST" action = "j_security_check">
      <table border = "0">
        <tr>
          <td>Login</td>
          <td><input type = "text" name="j_username"></td>
        </tr>
        <tr>
          <td>Password</td>
          <td><input type = "password" name="j_password"></td>
        </tr>
      </table>
      <input type = "submit" value = "Login!">

    </form>

  </body>
</html>
```

Here you have to make sure that the login form must contain the form elements named j_username and j_password. The action in the <form> tag must be j_security_check. POST must be used as the form method. At the same time, you will have to modify the <login-config> tag to specify the auth-method as FORM –

```

<web-app>
...
<security-constraint>
  <web-resource-collection>
    <web-resource-name>SecuredBookSite</web-resource-name>
    <url-pattern>/secured/*</url-pattern>
    <http-method>GET</http-method>
    <http-method>POST</http-method>
  </web-resource-collection>

  <auth-constraint>
    <description>Let only managers use this app</description>
    <role-name>manager</role-name>
  </auth-constraint>
</security-constraint>

<security-role>
  <role-name>manager</role-name>
</security-role>

<login-config>
  <auth-method>FORM</auth-method>
  <form-login-config>
    <form-login-page>/login.jsp</form-login-page>
    <form-error-page>/error.jsp</form-error-page>
  </form-login-config>
</login-config>
...
</web-app>

```

Now when you try to access any resource with URL /secured/*, it will display the above form asking for the user id and password. When the container sees the "j_security_check" action, it uses some internal mechanism to authenticate the caller.

If the login succeeds and the caller is authorized to access the secured resource, then the container uses a session-id to identify a login session for the caller from that point on. The container maintains the login session with a cookie containing the session-id. The server sends the cookie back to the client, and as long as the caller presents this cookie with subsequent requests, then the container will know who the caller is.

If the login fails, then the server sends back the page identified by the form-error-page setting

Here, `j_security_check` is the action that applications using form based login have to specify for the login form. In the same form, you should also have a text input control called `j_username` and a password input control called `j_password`. When you see this, it means that the information contained in the form will be submitted to the server, which will check name and password. How this is done is server specific.

Conclusion

Authentication using JSP is done successfully .

Experiment No - 3

Aim : Connect MySQL database using JSP.

Theory :

Create Table

To create the Employees table in the EMP database, use the following steps –

Step 1

Open a Command Prompt and change to the installation directory as follows –

```
C:\>  
C:\>cd Program Files\MySQL\bin  
C:\Program Files\MySQL\bin>
```

Step 2

Login to the database as follows –

```
C:\Program Files\MySQL\bin>mysql -u root -p  
Enter password: *****  
mysql>
```

Step 3

Create the Employee table in the TEST database as follows –

```
mysql> use TEST;  
mysql> create table Employees  
(  
    id int not null,  
    age int not null,  
    first varchar (255),  
    last varchar (255)
```

```
);  
Query OK, 0 rows affected (0.08 sec)  
mysql>
```

Create Data Records

Let us now create a few records in the Employee table as follows –

```
mysql> INSERT INTO Employees VALUES (100, 18, 'Zara', 'Ali');  
Query OK, 1 row affected (0.05 sec)
```

```
mysql> INSERT INTO Employees VALUES (101, 25, 'Mahnaz', 'Fatma');  
Query OK, 1 row affected (0.00 sec)
```

```
mysql> INSERT INTO Employees VALUES (102, 30, 'Zaid', 'Khan');  
Query OK, 1 row affected (0.00 sec)
```

```
mysql> INSERT INTO Employees VALUES (103, 28, 'Sumit', 'Mittal');  
Query OK, 1 row affected (0.00 sec)
```

```
mysql>  
SELECT Operation
```

Following example shows how we can execute the SQL

SELECT statement using JSTL in JSP programming –

```
<%@ page import = "java.io.*,java.util.*,java.sql.*"%>  
<%@ page import = "javax.servlet.http.*,javax.servlet.*" %>  
<%@ taglib uri="http://java.sun.com/jsp/jstl/core" prefix = "c"%>  
<%@ taglib uri="http://java.sun.com/jsp/jstl/sql" prefix = "sql"%>
```

```
<html>  
  <head>  
    <title>SELECT Operation</title>  
  </head>
```

```

<body>
  <sql:setDataSource var = "snapshot" driver =
"com.mysql.jdbc.Driver"
    url = "jdbc:mysql://localhost/TEST"
    user = "root" password = "pass123"/>

  <sql:query dataSource = "${snapshot}" var = "result">
    SELECT * from Employees;
  </sql:query>

  <table border = "1" width = "100%">
    <tr>
      <th>Emp ID</th>
      <th>First Name</th>
      <th>Last Name</th>
      <th>Age</th>
    </tr>

    <c:forEach var = "row" items = "${result.rows}">
      <tr>
        <td><c:out value = "${row.id}"/></td>
        <td><c:out value = "${row.first}"/></td>
        <td><c:out value = "${row.last}"/></td>
        <td><c:out value = "${row.age}"/></td>
      </tr>
    </c:forEach>
  </table>

</body>
</html>

```

Access the above JSP, the following result will be displayed –

Emp ID	First Name	Last Name	Age
100	Zara	Ali	18
101	Mahnaz	Fatma	25
102	Zaid	Khan	30
103	Sumit	Mittal	28

INSERT Operation

Following example shows how we can execute the SQL INSERT statement using JTSL in JSP programming –

```
<%@ page import = "java.io.*,java.util.*,java.sql.*"%>
<%@ page import = "javax.servlet.http.*,javax.servlet.*" %>
<%@ taglib uri="http://java.sun.com/jsp/jstl/core" prefix = "c"%>
<%@ taglib uri="http://java.sun.com/jsp/jstl/sql" prefix = "sql"%>
```

```
<html>
<head>
<title>JINSERT Operation</title>
</head>

<body>
<sql:setDataSource var = "snapshot" driver =
"com.mysql.jdbc.Driver"
url = "jdbc:mysql://localhost/TEST"
user = "root" password = "pass123"/>
<sql:update dataSource = "${snapshot}" var = "result">
INSERT INTO Employees VALUES (104, 2, 'Nuha', 'Ali');
</sql:update>
```

```

<sql:query dataSource = "${snapshot}" var = "result">
    SELECT * from Employees;
</sql:query>

<table border = "1" width = "100%">
    <tr>
        <th>Emp ID</th>
        <th>First Name</th>
        <th>Last Name</th>
        <th>Age</th>
    </tr>

    <c:forEach var = "row" items = "${result.rows}">
        <tr>
            <td><c:out value = "${row.id}"/></td>
            <td><c:out value = "${row.first}"/></td>
            <td><c:out value = "${row.last}"/></td>
            <td><c:out value = "${row.age}"/></td>
        </tr>
    </c:forEach>
</table>

</body>
</html>

```

Access the above JSP, the following result will be displayed –

Emp ID	First Name	Last Name	Age
100	Zara	Ali	18
101	Mahnaz	Fatma	25
102	Zaid	Khan	30

103	Sumit	Mittal	28
104	Nuha	Ali	2

DELETE Operation

Following example shows how we can execute the SQL DELETE statement using JTSL in JSP programming –

```
<%@ page import = "java.io.*,java.util.*,java.sql.*"%>
<%@ page import = "javax.servlet.http.*,javax.servlet.*" %>
<%@ taglib uri="http://java.sun.com/jsp/jstl/core" prefix = "c"%>
<%@ taglib uri="http://java.sun.com/jsp/jstl/sql" prefix = "sql"%>
```

```
<html>
<head>
<title>DELETE Operation</title>
</head>

<body>
<sql:setDataSource var = "snapshot" driver =
"com.mysql.jdbc.Driver"
url = "jdbc:mysql://localhost/TEST"
user = "root" password = "pass123"/>

<c:set var = "empld" value = "103"/>

<sql:update dataSource = "${snapshot}" var = "count">
DELETE FROM Employees WHERE Id = ?
<sql:param value = "${empld}" />
</sql:update>

<sql:query dataSource = "${snapshot}" var = "result">
SELECT * from Employees;
</sql:query>
```

```

<table border = "1" width = "100%">
  <tr>
    <th>Emp ID</th>
    <th>First Name</th>
    <th>Last Name</th>
    <th>Age</th>
  </tr>

  <c:forEach var = "row" items = "${result.rows}">
    <tr>
      <td><c:out value = "${row.id}"/></td>
      <td><c:out value = "${row.first}"/></td>
      <td><c:out value = "${row.last}"/></td>
      <td><c:out value = "${row.age}"/></td>
    </tr>
  </c:forEach>
</table>

</body>
</html>

```

Access the above JSP, the following result will be displayed –

Emp ID	First Name	Last Name	Age
100	Zara	Ali	18
101	Mahnaz	Fatma	25
102	Zaid	Khan	30

UPDATE Operation

Following example shows how we can execute the SQL UPDATE statement using JTSL in JSP programming –

```
<%@ page import = "java.io.*,java.util.*,java.sql.*"%>
```

```

<%@ page import = "javax.servlet.http.*,javax.servlet.*" %>
<%@ taglib uri = "http://java.sun.com/jsp/jstl/core" prefix = "c"%>
<%@ taglib uri = "http://java.sun.com/jsp/jstl/sql" prefix = "sql"%>

<html>
  <head>
    <title>DELETE Operation</title>
  </head>

  <body>
    <sql:setDataSource var = "snapshot" driver =
"com.mysql.jdbc.Driver"
      url = "jdbc:mysql://localhost/TEST"
      user = "root" password = "pass123"/>

    <c:set var = "empld" value = "102"/>

    <sql:update dataSource = "${snapshot}" var = "count">
      UPDATE Employees SET WHERE last = 'Ali'
      <sql:param value = "${empld}" />
    </sql:update>

    <sql:query dataSource = "${snapshot}" var = "result">
      SELECT * from Employees;
    </sql:query>

    <table border = "1" width = "100%">
      <tr>
        <th>Emp ID</th>
        <th>First Name</th>
        <th>Last Name</th>
        <th>Age</th>
      </tr>

      <c:forEach var = "row" items = "${result.rows}">

```

```
<tr>
  <td><c:out value = "${row.id}"/></td>
  <td><c:out value = "${row.first}"/></td>
  <td><c:out value = "${row.last}"/></td>
  <td><c:out value = "${row.age}"/></td>
</tr>
</c:forEach>
</table>

</body>
</html>
```

Access the above JSP, the following result will be displayed –

Emp ID	First Name	Last Name	Age
100	Zara	Ali	18
101	Mahnaz	Fatma	25
102	Zaid	Ali	30

Conclusion :

Hence we have successfully implemented to connect MySQL database using JSP.

Experiment No – 04

Aim : Design and development of Online Book Shop using JSP/Node.js & React .js

Theory :

The goal of this project is to show the core concepts of building SPA with ExpressJS and Angular.

1. Wrapped each major feature into a module
2. Lazy-loading for most of the modules so the app can start faster
3. Preload lazy-loaded modules after the app starts so they can be ready for use as soon as possible
4. Shared module for components, directives and pipes that can be imported into any feature module
5. Services for each major feature
6. Guards to prevent unauthorized users to view routes that require authentication or admin rights
7. Interceptors for attaching JWT token to the request headers, showing notifications from the server response and error handling
8. Custom directives
9. Custom pipe
10. TypeScript models
11. Reactive forms for handling user input

Installation Steps

Book Store requires

- MongoDB v3.6+
- NodeJS v8+
-

To start the database (port: 27017): Install MongoDB, open new cmd window (in project root) and run

1. \$ cd server
2. \$ start-mongodb

To add initial seeding: (do this step once only the first time you start the app) After you start MongoDB open new cmd window (in project root) and run

1. \$ cd server
2. \$ seedBooks

To start the server (port: 8000): open new cmd window (in project root) and run

1. \$ cd server
2. \$ npm install (if you havent already installed the dependencies)
3. \$ npm start

To start the client (port: 4200): open new cmd window (in project root) and run

1. \$ cd client
2. \$ npm install (if you havent already installed the dependencies)
3. \$ ng serve

Features :

1. **Anonymous users**
 0. Login/Register

1. View all books
2. View books details, rating and comments

2. Authenticated users

0. Buy books
1. Rate books
2. Comment books
3. View user profiles
4. View his own purchases history
5. Create favorite books list
6. Can change his own avatar

3. Admin users

0. Add books to the store
1. Edit books
2. Delete books
3. Edit/Delete offensive user comments
4. Block/Unblock user from commenting
5. Change inappropriate user avatars

Conclusion :

Hence we have successfully implemented design and development of Online Book Shop using JSP/Node.js & React .js .
